Non-invasive method for diagnosis of hypertrophic cardio-myopathy useful for testing asymptomatic individual(s)

Example 1; Col 10; 22pp; English.

AAQ91121-Q91130 are nested PCR primers used for the amplification and identification of beta-cardiac myosin heavy-chain RNA. They are used in a new non-invasive method for diagnosing hypertrophic cardiomyopathy (HC), the method involves detecting the presence or absence of specific HC-sasociated mutations in the beta-cardiac myosin heavy-chain obstained from a blood sample. The method may be used to diagnose familial or sporadic HC and the non-invasive method is particularly important when testing

The mutations associated with SHC/FHC are detected in the myosin gene isolated from blood, by detecting mis-matched areas in RNA-DNA hybrid double strands (RNA from the normal gene, DNA from the suspect asample). FHC associated point mutation can be classified and used to determine life expectancy in affected individuals e.g. using a Kaplan-Meier curve for the classified type of FHC causing point mutation. Also included are an RNA probe comprising ribonucleotides arranged in a fequence which is complementary to at least a portion of beta-cardiac myosin heavy-chain DNA and a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two
asymptomatic individuals suspected of having the disease. The method has a broad applicability and may be used to detect mutations responsible for other genetically inheritable diseases e.g. cystic fibrosis, Gaucher's disease, haemophilia A and B. Duchenne's muscular dystrophy, sickle cell anaemia, Tay-Sachs disease and phenylketonuria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    familial hypertrophic cardiomyopathy; SHC; Gaucher's disease; sporadic hypertrophic cardiomyopathy; life expectancy; haemophilia; buchenne's muscular dystrophy; sickle cell anaemia; Tay-Sachs disease; phenylketonuria; cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting a presence or absence of a mutation associated with hypertrophic cardiomyopathy, useful for diagnosing cystic fibrosis or hemophilia, by detecting a mutation in an amplified product of a beta cardiac myosin heavy-chain DNA.

oligonucleotides capable of amplifying beta-cardiac myosin heavy-chain DNA. The method is useful for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. This method is especially useful for diagnosing off and FHC, as well as for determining the estimated the life expectancy of a person with familial hypertrophic cardiomyopathy. In particular, the method is useful for determining an individual's genetic information, and diagnosing e.g. Gaucher's disease, haemophilia, Duchenne's muscular dystrophy, sickle cell anaemia, Tay-Sachs disease, phenylketonuria or cystic fibrosis. The present sequence is a PCR primer used to amplify a region of the beta cardiac myosin heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy (familial or sporadic, FHC, SHC) for facilitating the diagnosis of hypertrophic cardiomyopathy, comprising amplifying beta-cardiac myosin heavy-chain DNA forming an associated with hypertrophic cardiomyopathy in the amplified product, thus, facilitating the diagnosis of hypertrophic cardiomyopathy. Also included are a set of DNA oligonuclectide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting mutations associated with hypertrophic cardiomyopathy to diagnose hypertrophic cardiomyopathy, comprises amplifying beta-cardiac myosin heavy-chain DNA and detecting the mutation in the amplified
                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, beta cardiac myosin, heavy chain, PCR, primer; ss, FHC, SHC, familial hypertrophic cardiomyopathy, sporadic hypertrophic cardiomyopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human beta cardiac myosin heavy chain mutation detection primer B.

Detection of minutely mutated DNA useful for detection and treatment of Pseudomonas aeruginosa, and development of antibacterial agents comprises cloning a structurally characterized DNA. Example 6; Fig 6; 13pp; Japanese. AAF27237/c ID AAF27237 standard; DNA; 34 BP 99JP-00121957. (DAUC) DAIICHI PHARM CO LTD. WPI; 2001-127778/14. 28-APR-1999;

region by concentrating the DNA of interest using a substance which specifically recognises the structurally characterised region or a fragment thereof, and selectively cloning only the DNA of interest by subtraction treatment. The invention especially relates to a method for cloning or detecting a minutely mutated DNA by concentrating the mutated DNA using a substance (such as a mismatch repair protein) which capecifically recognises mismatched DNA, and selectively cloning only the mutant DNA. Such a method of detection may also be used in the diagnosis of disease associated with DNA mutations. The method was exemplified by the cloning and sequencing of DNA from the PAO128 strain of Pseudomonas aeruginosa using an immobilised maltose binding protein (MBP)-MutS fusion protein, and the corresponding DNA from pseudomonas aeruginosa strain PAO1 (which was designated as the wild-type). The MutS portion of the fusion protein recognised mismatches in PAO1/PAO128 DNA duplexes. The mutant (i.e., PAO128) DNA was thus concentrated, amplified via PCK, and contaminating DNA removed by RDA. A Pseudomonas aeruginosa strain PAO128 library was constructed and its genome sequenced. Such a protocol may be development of an unidentified gene from Pseudomonas aeruginosa strain capened on 11-SEP-2003 to standardise OS field)

Use of avian adenovirus for producing recombinant proteins by mixing vector containing avian adenovirus DNA with purified adenovirus DNA, introducing DNA mixture into embryonated avian egg, and harvesting proteins.

Example 5; Page 22; 70pp; English.

٠,٠

The invention relates to a method of cloning a a structurally characterised DNA or a flanking DNA containing part of the characterised

The present sequence was used in the construction of recombinant human C-reactive protein (CRP). It was used in an example illustrating an invention relating to the use of avian adenovirus for producing

```
ö
recombinant proteins in an avian egg. The method involves preparing a vector containing avian adenovirus DNA, preparing a mixture of vector DNA with purified adenovirus DNA or adenovirus particles, introducing mixture into embryonated avian egg or avian cell culture, incubating, and harvesting fluids from egg containing recombinant protein molecule encoded by vector DNA. The method is useful for producing recombinant proteins such as therapeutic proteins, immunostimulatory proteins, or tumour antigens in an avian egg. The eggs may be used as a vaccine to elicit an immunological response to the antigenic portion of the protein encoded by the DNA present in the chimeric gene of a prepared infectious adenovirus. The chicken adenovirus expression vector (AdGEV) egg system is simple, and economical and allows isolation of the protein in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a purified aggrecanase polypeptide and the polypurlectide encoding it. The polypeptide is useful in a method for developing inhibitors of aggrecanase, where the method comprises three dimensional structural analysis or computer aided drug design. The sequences of the invention are useful for inhibiting or preventing the effects of aggrecanase. The sequences and for inhibiting the proteolytic activity of aggrecanase. The sequences and the inhibitors are useful for treating various aggrecanase-associated conditions such as osteoarthritis, conditions characterised by the degradation of articular cartilage, or diseases characterised by degradation of aggrecan and/or an upregulation of aggrecanase, and also for detecting or diagnosing genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel purified aggrecanase polypeptide useful for developing inhibitors of aggrecanase for treating various aggrecanase-associated conditions such as osteoarthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, aggrecanase, primer, computer aided drug design, osteoarthritis, aggrecan; genetic disorder; proteolytic activity, articular cartilage, osteopathic; antiarthritic; ss; PCR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel nucleic acid molecules comprising a nucleotide sequence encoding a polypeptide that mediates phosphate uptake into the a plant cell in the presence of a mycorrhizal fungus, but not under conditions of phosphate deficiency, phosphate sufficiency, or a nucleotide sequence encoding a polypeptide that mediates phosphate uptake into the plant cell in response to phosphate availability. The nucleic acids are useful in plant biotechnology, particularly in regulating transport and translocation of phosphorus in plants, or in modifying the uptake or translocation of phosphorus in photosynthetic plants, e.g. maize, soybean, barley, alfalfa, suuflower, canola, tomato, banana, cotton, peanut, sorghum, tobacco, sugarbeet, wheat or rice. This phosphate transporter proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acids encoding polypeptides that mediate phosphate uptake into plant cells, useful in plant biotechnology, particularly in regulating transport and translocation of phosphorus in photosynthetic
disorders in which aggrecanase is irregularly transcribed or expressed. This sequence represents a PCR primer used to amplify human aggrecanase

AAV81521-60 were used for construction of a synthetic Streptoverticillium sp. transglutaminase gene (see AAV81508). The synthetic gene is codon altered for high expression in Escherichia coli. The specification describes a new microbial transglutaminase that has the N-terminal aspartic acid of transglutaminase deleted. Eliminating the N-terminal Asp from microbial transglutaminase allows efficient removal of the terminal Met residue added when the protein is expressed in E. coli. The E. coli methionine aminopeptidase acts well on Met-Ser but only poorly on Met-Asp, so problems of antigenicity associated with Met-terminated proteins are avoided. Recombinant transglutaminase is used to produce gelled foods (jellies, yogurt and cheeses) or cosmetics, to improve the quality of meet, in the production of materials for microcapsules of high thermal stability and as a carrier for immobilised enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New microbial transglutaminase with N-terminal aspartic acid deleted -allowing high level recombinant production without added methionine in E. coli, useful in production of gelled foods, cosmetics etc.
                                                                                   Transglutaminase, microbial; gelled food; jelly; yogurt; cheese; cosmetic; meat quality; microcapsule production; high thermal stability; carrier; immobilised enzyme; codon optimised; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transglutaminase; gelled food; jelly; yoghurt; gelled cosmetic; cheese;
                                               Oligonucleotide used for codon optimisation of transglutaminase gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The human CTLA-1 transcriptional control region was amplified directly from human genomic DNA by PCR using oligonuclectides AAQ77829 and AAQ77830. The amplified product was operatively linked to a reporter gene encoding chloramphenicol acctyl transferase (CAT) in a HyTK plasmid. A fragment spanning the HCWV IE94 enhancer was ligated upstream of the CTLA-I-CAT. The plasmid was electroporated into human Jurkat cells. The CTLA-1 transcriptional control region in combination with the CMV enhancer mediates activation-induced expression in human T lymphocytes. (Updated

AAV81521-60 were used for construction of a synthetic Streptoverticillium sp. transglutaminase gene (see AAV81508). The synthetic gene is codon deltered for high expression in Escherichia coli. The specification describes a new microbial transglutaminase that has the N-terminal aspartic acid of transglutaminase deleted. Eliminating the N-terminal from microbial transglutaminase deleted. Eliminating the N-terminal Asp from microbial transglutaminase allows efficient removal of the terminal Met residue added when the protein is expressed in E. coli. The E. coli methionine aninopeptidase acts well on Met-Ser but only poorly on Methio, so problems of antigenicity associated with Met-terminated proteins are avoided. Recombinant transglutaminase is used to produce gelled foods (jellies, yogurt and cheses) or cosmetics, to improve the quality of meat, in the production of materials for microcapsules of high thermal stability and as a carrier for immobilised enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for producing active transglutaminase from denatured enzyme. The method comprises: (i) forming an intermediate structure of the enzyme having transglutaminase activity under acidic conditions in an aqueous medium; and (ii) forming a higher-level structure of the enzyme having transglutaminase activity under neutral conditions in an aqueous medium. The method can be used for industrial production of active transglutaminase from denatured material
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Production of active transglutaminase from denatured enzyme by two-stage refolding process for industrial production of active enzyme for use in
New microbial transglutaminase with N-terminal aspartic acid deleted -allowing high level recombinant production without added methionine in coli, useful in production of gelled foods, cosmetics etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Transglutaminase; gelled food; jelly; yoghurt; gelled cosmetic; cheese;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transglutaminase related oligonucleotide sequence SEQ ID NO:25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              52.0%; Score 15.6; DB 2; Length 50; 81.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for producing active transglutaminase from denatured enzyme. The method comprises: (i) forming an intermediate structure of the enzyme having transglutaminase activity under acidic conditions in an aqueous medium, and (il) forming a higherneutral conditions in an aqueous medium; and (il) forming a higherneutral orditions in an aqueous medium. The method can be used for industrial production of active transglutaminase from denatured material (such as recombinant transglutaminase) which can be used in the food chock industry for the production of gelled foods such as jellies, yoghurts and cheeses, and for the production of gelled cosmetics. The present sequence represents an objective which is used in the exemplification from
                                                                                                                                                                                                                                                                                two-stage

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of a primer used in a PCR amplification designed to add an endoplasmic reticulum retention signal in frame to the C-terminus of the chymotrypsin inhibitor 2A (G-2A) in plasmid pCWNDipepER/CI-2A (see AAZS8432). The invention relates to improvements in CellScreen technology that encompass screening in prokaryotic as well as eukaryotic cells, and which can be used to identify and/or prepare peptides or RNAs capable of modulating the activity in vivo of target enzymes in eukaryotic cells. Previously unknown interactions between targets and ligands can be identified. Enzyme inhibitor structures such as CI-2A are used as scaffolds to display intracallularly potentially biologically active peptides or RNAs in a stable form. Preparation of a medicinal product is based on initial identification of targets or
(such as recombinant transglutaminase) which can be used in the food industry for the production of gelled foods such as jellies, yeghurts and cheeses, and for the production of gelled cosmetics. The present sequence represents an oligonucleotide which is used in the exemplification from
                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel screen comprising a pool of vectors with randomly modified nucleotide sequences, useful for identifying modulators of enzyme activity useful for selecting antibiotic agents.
                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to carcinostatic, cytostatic or anti-viral agents comprising an IRG27 polypeptide that is induced by a mutated or modified cancer controlling gene p53, a cytokine that controls cell growth and/or by differentiation and is increased in cancer tissue. The gene and IRG27 are useful for treatment and prevention of cancer and viral infection. The present sequence is that of a PCR primer for amplifying the IRG27 encoding polymucleotide
                                                                                                                                                                                                                            Human, IRG27, carcinostatic, cytostatic, anti-viral, cancer, cytokine, cell growth, differentiation, p53, infection, PCR primer, 88.

The invention relates to a G protein-coupled receptor (GPCR) IGS70

polypeptide including sequences that are 98-99.6% identical. Also
included are the polymucleotide encoding IGS70 (including sequences 98-
09.6% identical to the polymucleotide or the DNA insert contained in
plasmid CBS 109818), a hybridisation probe derived from the
comprising the expression system producing IGS70, a host
comprising the expression system IGS70 receptor membrane preparation
derived from the cell, an antibody immunospecific for IGS70, IGS70 is
comprising the expression or activity of the IGS70 polypeptide in a
cusful for diagnosing a disease or a susceptibility to disease in a
cubject related to expression or activity of the IGS70 polypeptide in a
cubject by determining the presence or absence of mutation in the
cubject by determining the presence or absence of entail mentifying agonist
contained from the subject. IGS70 is also useful identifying agonist
contained from the subject. IGS70 is also useful identifying agonist
cor antagonists. The IGS70 protein, polymucleotide, antibody and identified
contained are useful for treating psychiatric and central nervous
contained percents, myocardial infarction, kidney disease such as
continue, angina pectoris, myocardial infarction, kidney disease such as
crenal failure, gastrointestinal disorders such as jastric ulcer,
contained (IBS), inflammatory bowel disease, ulcers such as gastric ulcer,
contained (IBS), inflammatory bowel disease, ulcers such as gastric ulcer,
contained protozoal) especially human immunodeficiency virus infection
(HIV), diabetes, osteoporosis and allergies. The present sequence is a
contained to isolate the CDNA encoding the human GPCR IGS70

Each amplified C-gamma-1 and C-kappa gene fragment contd. several hundred base pair flanking sequences at both the 5' and 3' end. The kappa constant region was amplified from ARH-77 genomic DNA using PCR. The primers used are found in AAQ45506 (5' primer) and AAQ45507 (3' primer). The amplified DNA was verified to be the kappa constant region by Southern blot (AAQ45511 for probe) and sequence analysis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                       Recombinant and chimeric antibodies to C-ERBB-2 - used as therapeutic and diagnostic agents for tumours expressing C-ERBB-2.

Lysoenzyme is useful in cleavage of glycosidic bonds in the cell walls of bacteria, causing lysis. The LYC4 polypeptide can be used in preserving the freshness of foods including meat and wine. It may also be used as an antibacterial agent through its ability to cleave glycosidic bonds to antibacterial ealer. LYC4 is also a non-specific immune molecule, inhibitor of tumour growth e.g. stoanch cancer and mammary cancer. Sequences AAA07726-27 represent PCR primers for amplifying LYC4 CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAT04796 and AAT04797 are primers used to amplify T cell receptor (TCR) DNA sequences from rheumatoid arthritis (RA) patients, for analysis of the TCR alpha rearrangements. The amplified sequences are derived from synovial tissue T cells and encode the alpha region of the CDR3 region of the TCR. Both alpha and beta chain DNA can be used as probes in the diagnosis of RA and can also be used for immunotherapy for RA, e.g. by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              using them as blocking antigenic peptides, activation of immunoregulatory cells, induction of an anti-TCR antibody or in monoclonal antibody

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                 The present invention relates to methods for transformation of plants. The methods comprise ligating an operon containing a promoter and 2-100 genes of interest, to a vector and integrating the resulting recombinant vector into a plastid chromosome. The methods are useful for transforming brassicaceae, Composites, Pedaliaceae, Olacecae, Maraceae, Rosaceae, Theaceae, Composites, Pedaliaceae, Olacecae, Myraceae, Rosaceae, Theaceae, Leguminosae, Palmae, Sterouliaceae or Rubiaceae, in particular objoyester at abacum of Solanaceae family, for producing polyester, which is polyester synthase genes were used in the method to generate a plant which produces polyester. The present sequence is a PCR primer for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lysoenzyme; LYC4; glycosidic bond; food preservation; antibacterial; tumour inhibition; stomach cancer; mammary cancer; human; PCR primer; ss.
                                                                                  Transforming plants for producing polyester, involves ligating an operon containing a promoter and several genes of interest to a vector and integrating the recombinant vector into a plastid chromosome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel gene of human lysozyme family with human LYC4 protein activity, antibacterial effect and function of inhibiting tumor growth, useful e.g. in anti-bacterial and anti-cancer agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides a human lysoenzyme polypeptide LYC4. The LYC4 polypeptide can be expressed by standard recombinant methodology.
                                                                                                                                                                                                                                                                                                                                                                                 polyester synthase gene poly-3-hydroxybutyrate synthase (phbC:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral blood mononuclear cells (PBMCs) of patients having the disease as compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample is a whole blood sample (Calaimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples is solated at different stages of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                             ss; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Stover JA;

```
TCR V-alpha and V-beta rearrangements were studied in 16 MS brains and in 10 control brains. TCRValpha-dalpha-Calpha and Vbeta-Dbeta-Dbeta-Carbeta decrarangements were confirmed with Southern blotting and hybridisation of the PCR product obtained by amplification using a Calpha or Cbeta primer and a Valpha or a Vbeta specific primer. See AAQ15052-92 for Valpha, Vbeta, Calpha and Cbeta primers. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                  Method for diagnosing T-cell associated disease - comprises identifying rearranged variable region of appropriate T-cell also T-cell compsns. for treating neo:proliferative conditions.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B Virus (HBV) RNA. The nucleic acid molecules include antisense and enzymes, zinzymes, amberzymes, and enzymes, also disclosed and enzymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptenners that bind to HBV reverse transcriptase and/or HBV reverse transcriptase and/or HBV reverse transcriptase and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and method for screening compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocallular expression and acceptables of the HCV DNAZyme or arciname. The present sequence represents one of the HCV DNAZyme or
                                                                                                                                                                                                treating cirrhosis, liver failure, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR primers AAV42608-11 were used to amplify the T cell receptor (TCR) alpha chain cDNA. The products were used to prepare effector T cells with tumour specificicity. The specification describes a method for treatment
                                                              Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                             The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ror treatment of cancer, infection, autoimmune disease and graft rejection, also treatment by administering lymphocytes treated in vitro by these antigens.

microsatellite markers and used for the amplification of the rose genome.

The invention also describes a test kit for genetic analysis of cultured or wild forms of the genus Rosa sp. that contains at least one of the new oligonucleotide primers and preparing microsatellite markers of Rosa sp. by PCR amplification of hypervariable genomic regions, using at least one primer pair, to produce polymorphic fragments which are separated and etected. The primer pair, fragments which are separated and amplified. The amplified markers are separated by electrophoresis, especially on high-resolution agarose or native or denatured polyacrylamide gels, or by mass spectrometry. After separation, the amplicons are detected by staining (ethidium bromide or silver), radioactive labelling and autoradiography, automated sequencing using radioactive labelling and autoradiography, automated sequencing using primers labelled with dyes or fluorophores or by mass spectrometry. A genomic library of 0.5-1.5 kb fragments from the rose variety inchtblick was constructed in pUC18 and used to transform Escherichia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
of cancer which comprises incubating lymphocytes with a tumour-specific antigen or autoimmune disease related antigen and a superantigen. The treated cells are then introduced into the patient. The superantigen and the tumour-specific antigen or autoimmune disease related antigen can be conjugated together. The products are used to treat cancer (carcinoma, melanoma, lymphoma etc.), infections (bacterial, viral or eukaryotic) and autoimmune disease (e.g. idiopathic thrombocytopaenic purpura, rheumatoid arthritis, systemic lupus erythematosus, multiple sclerosis etc.). The antigens either induce an immune response or inhibit a patholgical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotides from rose microsatellite markers, useful for genomic analysis, including identification of varieties and hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the new

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to preparation of natural and unnatural amino acids that (a) reacting a first amino acid and a keto acid with transaminase enzyme to produce an amino acid and pyruvate, and (b) reacting pyruvate with acetolactate synthase enzyme to produce a compound that does not react with transaminase enzyme. The amino acids produced in these processes are useful as flavouring agents, sweeteners, nutritional supplements, synthetic intermediates in the preparation of pharmaceuticals. Acetolactate synthase enzyme eliminates the keto acid produced by the transaminase enzyme reaction, thus preventing the production to completion. The preparation and driving the amino acid production to completion. The preparations are especially used to produce but an acid by achieves sequences AXV65623-24 represent PCR primers used for generating the E. coli K12 ilvA gene fragment. This is used in the
              microsatellites. Inserts in plasmids that hybridised were sequenced and the identified sequences selected for ability to differentiate between a set of 30 rose varieties. The oligonucleotides are used for genetic analysis of cultivated and wild types of roses, particularly for genetic mapping and labelling of mono- or poly-genic traits, selection, analysis of relatedness, identification of varieties and evaluation of varietial purity, identification of hybrids and plant breeding. The oligonucleotides are useful in automated processes, do not require commercial rose varieties. AbH68075-AbH68674 represent the PCR primers used to amplify the Rose microsatellite regions described in the method
                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 flavouring agent; sweetener; nutritional supplement; pharmaceutical; L-2-aminobutyrate; ilvA gene; PCR primer; ss.
coli and the cells tested against a high-density array of synthetic

The present invention describes a nucleic acid composition (I) for the expression of a functional member of the ATP-binding cassette (ABCA) subfamily of ABC transporters in a host cell comprises two or more different nucleic acid molecules, each of which encodes one or more different nucleic acid molecules, each of which encodes one or more compensation of an ABC transporter, where the domains are functionally comprising of an ABC transporter of the ABCA subfamily of ABC transporters in a host cell; (3) a system for expressing a functional member of the ABCA subfamily of ABC transporters in a host cell comprising to comprising to a method of treating a mammal in need of functional member of the ABCA subfamily of ABC transporters; (6) a pharmaceutical composition of system; (5) a method of transporters; (6) a pharmaceutical composition of the ABCA subfamily of ABC transporters in a host cell. The nucleic acid composition (I) can be used for the expression of a functional member of the ABCA subfamily of ABC transporters in a host cell, which is useful in treating a mammal in need of functional member of the ABCA subfamily of ABC transporters in a host cell, which is useful in treating a mammal in need of functional member of the ABCA subfamily of ABC transporters in a host cell, which is useful in treating a mammal in need of functional member of the ABCA subfamily of ABC transporters. The present sequence

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library.

Compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises comparises of at least one target sequence. The method of analysis comprises more compounds. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence or specific contactions of any gene, in mapping the 5' termin of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones contacting sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence contacting format directly from LSPTO at seedles uncapproce or pecific contacting the microarray. Note: The sequence or specific contact the sequence or specific contact the microarray. Note: The sequence or specific contact the seq

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conveying resistance to beet necrotic yellow vein virus (BNYVV) to sugar beet (Beta vulgaris) comprises introducing a DNA fragment having a nucleotide sequence which is homologous to the sequence of the genomic RNA 1 of BNYVV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Beet necrotic yellow vein virus (BNYVV) causes rhizomania disease in sugar beet plants. The present sequence is a PCR primer for BNYVV. The resulting PCR fragment was cloned and used to convey resistance to BNYVV to a sugar beet plant, to result in production of a transgenic BVYVV-resistant sugar beet plant
                                                                                                                                                                                                                                                           BNYVV-resistance; rhizomania; sugar beet; transgenic plant; PCR primer;

The invention relates to nucleic acid molecules that modulate replication treating a condition related to WNV infection e.g. pancreatitis, encating a condition related to WNV infection e.g. pancreatitis, encaphalitis, myocarditis, meningitis, neurologic infection, hepatitis, molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleocides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
                                            The specification describes a method for producing a protein in a eukaryotic cell, from an uncapped mRNA using sequences derived from the barley yellow dwarf virus PAV serotype (BYDV-PAV). The sequences are useful for increasing the production of a protein translated from an uncapped eukaryotic mRNA. Ax60064-74 represent 3 untranslated regions of viral genomes, and were used in the course of the invention. (Updated

                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for producing a protein in a everaryotic cell, from an uncapped mRNA using sequences derived from the barley yellow dwarf virus PAV serotype (BYDV-PAV). The sequences are useful for increasing the production of a protein translated from an uncapped eukaryotic mRNA AXK60075-85 represent 3' untranslated regions of viral genomes, and were used in the course of the invention. (Updated on 17-OCT-2003 to standardise OS field)

BRCA1 is a tumour suppressor protein. Methods and compositions from the present invention are useful for diagnosis of, determining predisposition to or lack of predisposition to, and treatment of human cancer, such as breast or pancreatic cancer, as a result of a nutation in C1IP or BRCA1. The methods and compositions can also be used in rational drug design for cancer therapeutics. The present sequence represents a PCR primer for B112 which is used in an example from the
                                                                                                                                                                                                                                                                                                                              interacting protein; B112; CtIP; tumour suppressor; cancer;
 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid

                                        The present invention relates to the preparation of synthetic nucleic acid molecules which have altered transcriptional regulatory sequences compared to the wild-type. These sequences are then transcribed with less frequency compared to the wild-type. In particular, the invention relates to altered luciferase sequences. This can be used to detect wask promoter activity, to express fusion proteins, to detect and/or measure levels of gene expression, subcellular localisation or targeting, in life science research, agrogenetics, gene therapy, developmental science and pharmaceutical development. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T helper cell; TH cell; T-cell; T-lymphocyte; 103 gene; differential expression; immune disorder; multiple sclerosis; asthma; lepromatous leprosy; diagnosis; therapy; primer; PCR; polymerase chain reaction; transgenic mouse; ss.

Genes which are differentially expressed within and among T helper (TH) cells and TH cell subpopulations, e.g. THO, TH1 and TH2 subpopulations, can be used diagnostically or as targets for therapeutic intervention. The polypeptides are useful for treating and diagnoshing of immune disorders, especially T lymphocyte-related disorders. These disorders include chronic inflammatory diseases and disorders (e.g. Crohn's disease, reactive arthritis, Lymme disease, Hashimoto's thyroidit's or Grave's disease), or atopic conditions (e.g. asthma and allergy, including allergic rhintis or food allergies). Also included are certain bathogen susceptibilities (e.g. leishmaniasis), and viral (e.g. HUV) or bacterial (e.g. tuberculosis or lepromatous leprosy) infections
                                            New isolated human 200 gene products or polypeptides, useful for treating and diagnosing immune disorders, especially T helper lymphocyte-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         103 gene, immune disorder, T helper lymphocyte 2 related disorder; TH2; ST2; T1; Fit-1; therapy, asthma; allergy, IgB; IL-4; antiviral; fimunoglobulin E mediated condition; interleukin-4 mediated condition; crohn's disease; arthitis; insulin-dependent diabetes; antihelminthic; multiple sclerosis; Hashimoto's thyroiditis; Grave's disease; contact dermatitis; psotiasis; allergic rhinitis; conjunctivitis; glomerular nephritis; systemic lupus erythematosus; eosinophilia; neuroprotective; ophthalmological; antibacterial; immunosuppressive; sarcoidosis; scleroderma; murine; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A 5' primer (AAT38281) and 3' primer (AAT38282) contg. 5' Spel and 3' bamHI sites were used to amplify the murine 103 gene (see also AAT38272) that is differentially expressed in T helper TH2 cells. Murine TH2-type cell line D1064 cDNA was used as template. The PCR product was used to replace the IL-10 gene in plasmid pCIL-10. The final construct, pCD2-1031-GH, contained the human CD2 enhancer and Pmu promoter and the murine 103 gene coding sequence. It was used to produce transgenic mice that expressed the 103 gene product (see also AAT38283-84). Such mice can be used as models of TH2 cell subpopulation-related disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Thelper cell; differential expression; 200 gene; immunomodulator; anti-inflammatory; anti-arthritic; antibacterial; immunosuppressive; thyromimetic; anti-thyroid; anti-asthmatic; anti-allergic; antiviral; protozoacide; lymphocyte; modulator; gene therapy; primer; ss.
                                                                                                                                                                                                                                                                                                                                                   Genes and their products differentially expressed in T helper cells useful in diagnosis and treatment of immune disorders, e.g. multiple sclerosis, asthma, lepromatous leprosy, etc.

The present invention describes a method for ameliorating a symptom of ischaemic disorder or injury in a mammal. The method comprises administering a 200 gene product, a nucleic acid encoding (S1) or an antibody directed against (S1). The method is useful for treating a symptom of an ischaemic disorder such as ischaemic renal disease or myocardial ischaemia (such as angina pectoris), myocardial or cortical infarction. The method is also useful for treating a symptom of an ischaemic injury occurring due to transplantation of a kidney. The present sequence represents a PCR primer which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cysteine protease; immune disorder; T lymphocyte; Crohn's; arthritis; diabetes; multiple sclerosis; viral infection; bacterial; HIV; ds.

                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                             diagnosis of immune disorders, especially T lymphocyte-related disorders.

The methods and compositions of the present invention particularly
relates to detection and/or modulation of expression and/or activity of
103 gene. This gene is alternatively referred as ST2, T1 and Fit-1 and is
differentially expressed in T helper lymphocyte 2 (TH2) cells Antibodies
gpecific for 103 gene are useful for the treatment and prevention of
immune disorders in humans, preferrably TH2 related disorders, such as
asthma, allergy, immunoglobulin E (IgE) mediated conditions and
interleukin-4 (IL-4) mediated conditions. Modulators of 103 gene such as
antibodies, ribozymes, antisense oligomucleotides and peptides are useful
for the treatment and diagnosis of immune disorders such as Crohn's
disease, archritis, insulin-dependent diabetes, multiple sclerosis,
Hashimoto's thyroidiis, Grave's disease, graft rejection, contact
dermatitis, psoriasis, allergic rhintis, conjunctivitis, graft- versus-
host disease, glomerular nephritis, sarcoidosis, eosinophilia, systemic
lupus erythematosus, scleroderma and helminthic (e.g leishmaniasis),
viral and bacterial infections (e.g. tuberculosis and lepromatous

The present invention relates to a novel cysteine protease. The protein of the invention is useful for treating and diagnosing immune disorders, especially Tlymphocyte-related disorders. In particular, the polypeptide is useful for treating or diagnosing Thelper (TH) cell or TH cell subpopulation-related disorders. These disorders include Crohn's disease, reactive arthritis, Lyme disease, insulin-dependent diabetes, organspecific autoimmunity, multiple sclerosis, Hashimoto's thyroiditis, Grave's disease, context dermatitis, psoriasis, graft rejection, graft versus host disease, sarcoidosis, atopic (e.g. asthma or allergy), eosinophilia, conjunctivitis, glomerular nephritis, or helminthic (e.g. leishmaniasis), viral (e.g. HU) (human immunodeficiancy virus) or bacterial (e.g. tuberculosis or lepromatous leprosy) infections
                                                                                                                                                                                                                                                                                                         polypeptide exhibiting cysteine protease activity, useful for
ing and diagnosing immune disorders, especially T lymphocyte-related
ders, e.g. Crohn's disease, multiple sclerosis, graft versus host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example; Col 93; 107pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnarces/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Submitted (31-MAR-2004) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by BAC clone T13D4. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the

The DNA fragment(s) resulting of Orysa sativa plants. The DNA fragment(s) resulting of determine the apequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding muctant line and a link to a database providing a graphical display is available from june 2004 at http://genoplante-info.infobiogen.fr/oryzatagline/.
